

**Amendment to the Specification:**

Please amend the specification as follows:

(Page 2, line 5) In other situations, images are often displayed in a plurality of colors on the screen, and the brightness ~~brightness~~ of the screen is inherently less. As a result, the user increases the display brightness of the screen so as to make it easier to watch the displayed images.

(Page 2, line 13) More particularly, the use of a specific type of display may also affect the resulting display brightness, and hence the user's visibility of the images displayed. For instance, for an LCD (Liquid Crystal Display), the visibility is often low at a dark display. This is because the pixels of the liquid crystal do not emit light themselves, unlike a CRT display. Therefore, it is known that a user of an LCD display must often adjust the brightness to improve the ~~user's~~ user's visibility of the screen images.
